West Collection bins with different Colors

Challenges.

- Rough roads from Borama to coastal towns were the main challenges that hinders to mobilize construction materials and local materials to the sites as early as we planned.
- Availability of construction materials in out rich places were also find difficult some places such as Saylac and Lughaya have no construction material suppliers and we had to take materials from big towns like Borama and that brings additional cost.
- Very limited skilled lab ours in the villages where HFs are. Therefore we planned to search and find experienced masons and crew who can build incinerators but this also became challenges
- Local Construction Materials in Zaila and Lughaya is very far and some times its difficult to get un skilled lab our of loading Stones and sand.
- Only Four Wheel trucks can work in coastal area and its very difficult to get logistically.
